The patient was a 60-year-old female who had been treated for breast cancer and had pulmonary metastases. She was admitted to our hospital for an examination of a paraaortic lymph node swelling in October 1995. A chest radiograph showed a tumor shadow in the left hilus of the lung. Chest computed tomography revealed a tumor of 15 x 8 x 10 cm in the left hilus of the lung. The paraaortic lymph node was swollen. Bronchoscopic examination revealed obstruction of the left upper lobe bronchus. Biopsy of the lymph node revealed metastases of undifferentiated small cell lung cancer. She was treated with combination chemotherapy. The serum LDH level was as high as 3,490 IU/l and a large number of tumor cells were found in a bone marrow specimen.Q: What is the best practice for merging/joining several MySQL tables? I've been tasked with creating a program that adds additional data to several existing MySQL databases. What I would like to do is to join/merge several databases together, so that the data from all the databases is displayed in a single table. I have an idea of how I'd go about doing this, but I'd like to hear your thoughts before proceeding any further. Since the DBs are linked by a single table, I could use a JOIN statement to merge them, but I would want to select the appropriate values from each table. I could also simply copy the data from each table into the new one, but this might be too inefficient. Here is an example: EXAMPLE: In the past, I've created a game server, where players had their own accounts and joined in on a single table, their individual player information was stored in a single table. However, because there was too much data, I decided to 5b5f913d15
